The project provides demonstrators to CrySIL (formerly „SkyTrust“).

The Cryptographic Service Interoperability Layer (CrySIL), formerly known as Skytrust, complements applied cryptography by transparently providing key material in central infrastructures that usually was kept locally. This project merges many of the contributions made to CrySIL in recent times. The result of this project is an information website which, alongside to A-SIT projects, scientific contributions and student projects on the topic of CrySIL, also presents a variety of demonstrators.
